ABSTRACT

PROBLEM TO BE SOLVED: To prevent the information, etc., from leaking out to the outsiders by limiting the input frequency of the password that attains a **security** function in a start mode and stopping semipermanently the start processing if the wrong input operations are performed in times more than a fixed number.

SOLUTION: In regard to a **security** management means 1022, a CMOS or a flash memory 1030 includes a wrong password check counter 1032 which counts the times of wrong passwords, a start stop flag 1033, a start stop cancel data area 1034 which decides a regular owner when the contents of the flag 1033 are changed to an OFF state from an ON state, and an infrared key device 1060. The flag 1033 is referred to as the first processing of the means 1022, and an interruption occurs in a normal PC **start** mode as long as the flag value is kept in an ON state. Then the start processing is stopped unless the signal inputted from an I/O port is **coincident** with the **value** of the area 1034 which is previously registered.

Abstract (Basic): TW 320697 A

The circuit is installed in a computer system, which includes one main board, one power supply and one keyboard. The circuit keyboard intercept unit (45) intercepts a keyboard signal between the keyboard and keyboard controller interface of the main board, when the computer system is in power off state. A keyboard input data decoder (41) accept the keyboard signal intercepted by the keyboard intercept unit and decodes it.

A first-in first-out buffer, connected to the output end of the keyboard input data decoder, buffers the decoded keyboard data with predetermined format by first-in first-out sequence. A password data memory stores the computer system power - on password. A comparison unit has two inputs separately receiving the first-in first-out buffer output and password data memory output. It compares them to see if both match and outputs the comparison result. A power supply controller unit receives the comparison result which is then used to decide whether to start up power supply to power on the computer system, if the password input by a user matches a preset password.
